

# THE HANGLINE APPROACH

for woodshop automation

For handling lighter parts that require full paint coverage on all areas and when open access to the floor is required.

Paint line conveyor moves kitchen cabinets into warmer, unused overhead space for shorter drying time.

Accumulation of tall wooden parts prior to unloading, using power and free conveyor.

Single conveyor line moves product through finishing process from sanding to staining, lacquer and drying.

Large wooden doors are conveyed from the finishing line through the assembly process to shipping.
